Proofs for Smoothness of Parametric Regression Models

November 4, 2016

Intro

In this document, we consider parametric regression models $g(\cdot|\boldsymbol{\theta})$ where $\boldsymbol{\theta} \in \mathbb{R}^p$. Throughout, we will suppose $\boldsymbol{\theta}^*$ is the model such that

$$\boldsymbol{\theta}^* = \arg\min_{\boldsymbol{\theta} \in \Theta} E_{x,y} \left[\left(y - g(x|\boldsymbol{\theta}) \right)^2 \right]$$

Technically, all the proofs require is that $\theta^* \in \Theta$ is fixed. In the convergence rate proofs, we will need θ^* to satisfy $E[y|x] = g(x|\theta^*)$. We are interested in establishing inequalities of the form

$$\|\hat{\boldsymbol{\theta}}_{\lambda^{(1)}} - \hat{\boldsymbol{\theta}}_{\lambda^{(2)}}\|_{2} \le C \|\lambda^{(2)} - \lambda^{(1)}\|_{2}$$

If the functions are Lipschitz in their parameterization, we will also be able to bound the distance between the actual functions. That is, if there are constants L>0 and $r\in\mathbb{R}$, such that for all θ_1,θ_2

$$||g(\cdot|\boldsymbol{\theta}_1) - g(\cdot|\boldsymbol{\theta}_2)||_{\infty} \le Lp^r ||\boldsymbol{\theta}_1 - \boldsymbol{\theta}_2||_2$$

Then

$$\|g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(2)}})\|_{\infty} \le Lp^r C \|\boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}\|_2$$

Document Outline

First, we consider smooth training criteria and prove smoothness for two parametric regression examples:

1. Multiple penalties for a single model

$$\hat{\boldsymbol{\theta}}_{\lambda} = \arg\min_{\boldsymbol{\theta} \in \mathbb{R}^p} \frac{1}{2} \| y - g(\cdot | \boldsymbol{\theta}) \|_T^2 + \sum_{j=1}^J \lambda_j \left(P_j(\boldsymbol{\theta}) + \frac{w}{2} \| \boldsymbol{\theta} \|_2^2 \right)$$

2. Additive model

$$\hat{\boldsymbol{\theta}}_{\lambda} = \arg\min_{\boldsymbol{\theta} \in \mathbb{R}^p} \frac{1}{2} \| y - \sum_{j=1}^J g_j(\cdot | \boldsymbol{\theta}_j) \|_T^2 + \sum_{j=1}^J \lambda_j \left(P_j(\boldsymbol{\theta}_j) + \frac{w}{2} \| \boldsymbol{\theta}_j \|_2^2 \right)$$

Then we will extend these results to non-smooth penalty functions.

Finally we will consider examples of parametric penalty functions. This includes a deep dive into the Sobolev penalty.

1 Multiple smooth penalties for a single model

The function class of interest are the minimizers of the penalized least squares criterion:

$$\mathcal{G}(T) = \left\{ \hat{\boldsymbol{\theta}}_{\lambda} = \arg\min_{\boldsymbol{\theta} \in \mathbb{R}^p} \frac{1}{2} \|y - g(\cdot|\boldsymbol{\theta})\|_T^2 + \sum_{j=1}^J \lambda_j \left(P_j(\boldsymbol{\theta}) + \frac{w}{2} \|\boldsymbol{\theta}\|_2^2 \right) : \boldsymbol{\lambda} \in \Lambda \right\}$$

where $\Lambda = [\lambda_{min}, \lambda_{max}]^J$ and w > 0 is a fixed constant.

Suppose that the penalties and the function $g(x|\theta)$ are twice-differentiable and convex wrt θ :

- Suppose that $\nabla^2_{\theta} P_j(\theta)$ are PSD matrices for all j = 1, ..., J.
- Suppose that $\nabla_{\theta}^2 ||y g(x|\theta)||_T^2$ is a PSD matrix.

Suppose there is some K > 0 such that for all j = 1, ..., J and any θ, β, m' , we have

$$\left| \frac{\partial}{\partial m} P_j \left(\boldsymbol{\theta} + m \boldsymbol{\beta} \right) \right|_{m=m'} \le K \|\boldsymbol{\beta}\|_2$$

Then for any $\lambda^{(1)}, \lambda^{(2)} \in \Lambda$ we have

$$\|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} - \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(2)}}\|_{2} \leq \|\boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}\|_{2} \left(w\sqrt{J}\lambda_{min}\right)^{-1} \left(K + w\sqrt{\frac{2}{J\lambda_{min}w}}\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)C_{J}\right)$$

where

$$C_J = \frac{1}{2} \|y - g(\cdot|\boldsymbol{\theta}^*)\|_T^2 + \lambda_{max} \sum_{i=1}^J \left(P_j(\boldsymbol{\theta}^*) + \frac{w}{2} \|\boldsymbol{\theta}^*\|_2^2 \right)$$

(Still thinking about how to make C_J more clear. Perhaps I can find a nicer bound for the Lipschitz constant)

Proof

Consider any $\lambda^{(1)}, \lambda^{(2)} \in \Lambda$. Let $\beta = \hat{\theta}_{\lambda^{(2)}} - \hat{\theta}_{\lambda^{(1)}}$. Define

$$\hat{m}_{\boldsymbol{\beta}}(\boldsymbol{\lambda}) = \arg\min_{m \in \mathbb{R}} \frac{1}{2} \left\| y - g(\cdot | \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta} \|_{2}^{2} \right)$$

By definition, we know that $\hat{m}_{\beta}(\lambda^{(2)}) = 1$ and $\hat{m}_{\beta}(\lambda^{(1)}) = 0$.

1. We calculate $\nabla_{\lambda}\hat{m}_{\beta}(\lambda)$ using the implicit differentiation trick.

By the KKT conditions, we have

$$\frac{\partial}{\partial m} \left(\frac{1}{2} \left\| y - g(\cdot | \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} P_{j} (\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right) + \sum_{j=1}^{J} \lambda_{j} w \langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta} \rangle \bigg|_{m = \hat{m}_{\boldsymbol{\beta}}(\boldsymbol{\lambda})} = 0$$

Now we implicitly differentiate with respect to λ_{ℓ} for $\ell=1,2,...,J$

$$\frac{\partial}{\partial \lambda_{\ell}} \left\{ \left[\frac{\partial}{\partial m} \left(\frac{1}{2} \left\| y - g(\cdot | \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} P_{j} (\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right) + \sum_{j=1}^{J} \lambda_{j} w \langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta} \rangle \right] \bigg|_{m = \hat{m}_{\boldsymbol{\beta}}(\boldsymbol{\lambda})} \right\} = 0$$

By the product rule and chain rule, we have

$$\left\{ \left[\frac{\partial^2}{\partial m^2} \left(\frac{1}{2} \left\| y - g(\cdot | \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right\|_T^2 + \sum_{j=1}^J \lambda_j P_j(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right) + \sum_{j=1}^J \lambda_j w \|\boldsymbol{\beta}\|_2^2 \right] \frac{\partial}{\partial \lambda_\ell} \hat{m}_{\boldsymbol{\beta}}(\boldsymbol{\lambda}) + \frac{\partial}{\partial m} P_\ell(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta} \rangle \right\} \bigg|_{m = \hat{m}_{\boldsymbol{\beta}}(\boldsymbol{\lambda})} = 0$$

Rearranging, for every $\ell = 1, ..., J$, we get

$$\frac{\partial}{\partial \lambda_{\ell}} \hat{m}_{\beta}(\boldsymbol{\lambda}) = -\left[\frac{\partial^{2}}{\partial m^{2}} \left(\frac{1}{2} \left\| y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) \right) + \sum_{j=1}^{J} \lambda_{j} w \|\boldsymbol{\beta}\|_{2}^{2}\right]^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta \rangle\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta) + w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta)\right]_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}^{-1} \left[\frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\beta)\right]_{m$$

In vector notation, we have

$$\nabla_{\lambda}\hat{m}_{\beta}(\boldsymbol{\lambda}) = -\left[\frac{\partial^{2}}{\partial m^{2}}\left(\frac{1}{2}\left\|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta})\right\|_{T}^{2} + \sum_{j=1}^{J}\lambda_{j}P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta})\right) + \sum_{j=1}^{J}\lambda_{j}w\|\boldsymbol{\beta}\|_{2}^{2}\right]^{-1}\left[\nabla_{m}P(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) + w\langle\boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}\rangle\mathbf{1}\right]\Big|_{m=\hat{m}_{\beta}(\boldsymbol{\lambda})}$$

where $\nabla_m P(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta})$ is the *J*-dimensional vector

$$\nabla_{m} P(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) = \begin{bmatrix} \frac{\partial}{\partial m} P_{1}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \\ \dots \\ \frac{\partial}{\partial m} P_{J}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \end{bmatrix}$$

2. Bound $\|\nabla_{\lambda}\hat{m}_{\beta}(\lambda)\|$

Bounding the first multiplicand:

The first multiplicand is bounded by

$$\left\| \frac{\partial^2}{\partial m^2} \left(\frac{1}{2} \left\| y - g(\cdot | \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda^{(1)}}} + m\boldsymbol{\beta}) \right\|_T^2 + \sum_{j=1}^J \lambda_j P_j(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda^{(1)}}} + m\boldsymbol{\beta}) \right) + \sum_{j=1}^J \lambda_j w \|\boldsymbol{\beta}\|_2^2 \right\|^{-1} \leq \left(wJ\lambda_{min} \|\boldsymbol{\beta}\|_2^2 \right)^{-1}$$

since the mean squared error and the penalty functions are convex.

Bounding the second multiplicand:

The first summand in the second multiplicand is bounded by assumption

$$\left| \frac{\partial}{\partial m} P_{\ell}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + m\boldsymbol{\beta}) \right| \leq K \|\boldsymbol{\beta}\|_{2}$$

The second summand in the second multiplicand is bounded by

$$\left| w \langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda}) \boldsymbol{\beta} \rangle \right| \leq w \|\boldsymbol{\beta}\|_{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda}) \boldsymbol{\beta}\|_{2}$$

$$\tag{1}$$

We need to bound $\|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_2$. By definition of $\hat{m}_{\beta}(\boldsymbol{\lambda})$,

$$\sum_{j=1}^{J} \lambda_{j} \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_{2}^{2} \leq \frac{1}{2} \|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) \\
= \frac{1}{2} \|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) \\
= \frac{1}{2} \|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) \\
= \frac{1}{2} \|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) \\
= \frac{1}{2} \|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) + \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j} \right) \left(\lambda_{j} - \lambda_{j} \right) \left(\lambda_{j} - \lambda_{j} \right) \right) \left(\lambda_{j} - \lambda_{j} \right) \right) \left(\lambda_{j} - \lambda_{j} \right) \left(\lambda_{j} - \lambda_{j} \right) \left(\lambda_{j}$$

To bound the first part of the right hand side, use the definition of $\hat{\boldsymbol{\theta}}_{\lambda^{(1)}}$:

$$\frac{1}{2} \|y - g(\cdot|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_{2}^{2} \right) \leq \frac{1}{2} \|y - g(\cdot|\boldsymbol{\theta}^{*})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\boldsymbol{\theta}^{*}) + \frac{w}{2} \|\boldsymbol{\theta}^{*}\|_{2}^{2} \right) \\
\leq \frac{1}{2} \|y - g(\cdot|\boldsymbol{\theta}^{*})\|_{T}^{2} + \lambda_{max} \sum_{j=1}^{J} \left(P_{j}(\boldsymbol{\theta}^{*}) + \frac{w}{2} \|\boldsymbol{\theta}^{*}\|_{2}^{2} \right) \\
= C$$

To bound the second part of the right hand side, note that

$$\sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} \|_{2}^{2} \right) \leq \sum_{j=1}^{J} \left(\lambda_{j} - \lambda_{j}^{(1)} \right) \left[\max_{k=1:J} P_{k}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} \|_{2}^{2} \right] \\
\leq J \lambda_{max} \left[\max_{k=1:J} P_{k}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} \|_{2}^{2} \right]$$

Combining the above three inequalities, we get

$$\sum_{j=1}^{J} \lambda_j \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_2^2 \le C + J\lambda_{max} \left[\max_{k=1:J} P_k(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_2^2 \right]$$

$$(2)$$

To bound $\max_{k=1:J} P_k(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} ||\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}||_2^2$, we note that by the definition of $\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}$, we have

$$\sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} \|_{2}^{2} \right) \leq \frac{1}{2} \| y - g(\cdot |\boldsymbol{\theta}^{*}) \|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\boldsymbol{\theta}^{*}) + \frac{w}{2} \| \boldsymbol{\theta}^{*} \|_{2}^{2} \right) \\
\leq C$$

Therefore

$$\max_{k=1:J} P_k(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}\|_2^2 \le \frac{C}{\lambda_{min}}$$
(3)

Plugging (3) into (2) above, we get

$$\sum_{i=1}^{J} \lambda_{j} \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_{2}^{2} \leq \left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) C \tag{4}$$

We can combine (4) with the fact that

$$J\lambda_{min}\frac{w}{2}\|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}+\hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_{2}^{2} \leq \sum_{j=1}^{J}\lambda_{j}\frac{w}{2}\|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}}+\hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_{2}^{2}$$

to get

$$\|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta}\|_{2} \leq \sqrt{\frac{2}{J\lambda_{min}w}\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)C}$$

Plug the inequality above into (1) to get

$$w\langle \boldsymbol{\beta}, \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} + \hat{m}_{\beta}(\boldsymbol{\lambda})\boldsymbol{\beta} \rangle \leq w\|\boldsymbol{\beta}\|_{2}\sqrt{\frac{2}{J\lambda_{min}w}\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)C}$$

Finally we have bounded the derivative of $\frac{\partial}{\partial \lambda_{\ell}} \hat{m}_{\beta}(\lambda)$. For every $\ell = 1, ..., J$, we have

$$\left| \frac{\partial}{\partial \lambda_{\ell}} \hat{m}_{\beta}(\boldsymbol{\lambda}) \right| \leq \left(w J \lambda_{min} \|\boldsymbol{\beta}\|_{2}^{2} \right)^{-1} \left(K \|\boldsymbol{\beta}\|_{2} + w \|\boldsymbol{\beta}\|_{2} \sqrt{\frac{2}{J \lambda_{min} w}} \left(1 + \frac{J \lambda_{max}}{\lambda_{min}} \right) C \right)$$

$$= \left(w J \lambda_{min} \|\boldsymbol{\beta}\|_{2} \right)^{-1} \left(K + w \sqrt{\frac{2}{J \lambda_{min} w}} \left(1 + \frac{J \lambda_{max}}{\lambda_{min}} \right) C \right)$$

We can sum up these bounds to bound the norm of the gradient $\nabla_{\lambda} \hat{m}_{\beta}(\lambda)$:

$$\|\nabla_{\lambda}\hat{m}_{\beta}(\boldsymbol{\lambda})\| = \sqrt{\sum_{\ell=1}^{J} \left(\frac{\partial}{\partial \lambda_{\ell}}\hat{m}_{\beta}(\boldsymbol{\lambda})\right)^{2}}$$

$$\leq \left(w\lambda_{min}\sqrt{J}\|\boldsymbol{\beta}\|_{2}\right)^{-1} \left(K + w\sqrt{\frac{2}{J\lambda_{min}w}\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)C}\right)$$

3. Apply Mean Value Theorem

Since the training criterion is smooth, then $\hat{m}_{\beta}(\lambda)$ is continuous and differentiable over the line segment $\{\alpha \lambda^{(1)} + (1-\alpha)\lambda^{(2)} : \alpha \in [0,1]\}$.

Therefore by MVT, there is some $\alpha \in (0,1)$ such that

$$\begin{aligned} \left| \hat{m}_{\beta}(\boldsymbol{\lambda}^{(2)}) - \hat{m}_{\beta}(\boldsymbol{\lambda}^{(1)}) \right| &= \left| \left\langle \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}, \nabla_{\lambda} \hat{m}_{\beta}(\boldsymbol{\lambda}) \right\rangle \right|_{\boldsymbol{\lambda} = \alpha \boldsymbol{\lambda}^{(1)} + (1-\alpha)\boldsymbol{\lambda}^{(2)}} \\ &\leq \left\| \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)} \right\|_{2} \left\| \nabla_{\lambda} \hat{m}_{\beta}(\boldsymbol{\lambda}) \right|_{\boldsymbol{\lambda} = \alpha \boldsymbol{\lambda}^{(1)} + (1-\alpha)\boldsymbol{\lambda}^{(2)}} \right\| \\ &\leq \left\| \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)} \right\|_{2} \left(w \sqrt{J} \lambda_{min} \|\boldsymbol{\beta}\|_{2} \right)^{-1} \left(K + w \sqrt{\frac{2}{J \lambda_{min} w} \left(1 + \frac{J \lambda_{max}}{\lambda_{min}} \right) C} \right) \end{aligned}$$

Recall that $\hat{m}_{\beta}(\lambda^{(2)}) - \hat{m}_{\beta}(\lambda^{(1)}) = 1$. Rearranging, we get

$$\|\boldsymbol{\beta}\|_{2} = \|\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} - \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(2)}}\|_{2} \leq \|\boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}\|_{2} \left(w\sqrt{J}\lambda_{min}\right)^{-1} \left(K + w\sqrt{\frac{2}{J\lambda_{min}w}}\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)C\right)$$

2 Additive Model

The function class of interest are the minimizers of the penalized least squares criterion:

$$\mathcal{G}(T) = \left\{ \hat{\boldsymbol{\theta}}_{\lambda} = \arg\min_{\boldsymbol{\theta} \in \mathbb{R}^p} \frac{1}{2} \left\| y - \sum_{j=1}^J g_j(\cdot | \boldsymbol{\theta}_j) \right\|_T^2 + \sum_{j=1}^J \lambda_j \left(P_j(\boldsymbol{\theta}_j) + \frac{w}{2} \|\boldsymbol{\theta}_j\|_2^2 \right) : \boldsymbol{\lambda} \in \Lambda \right\}$$

where $\Lambda = [\lambda_{min}, \lambda_{max}]^J$.

Suppose that the penalties and the mean squared error $\|y - \sum_{j=1}^{J} g_j(x|\boldsymbol{\theta}_j)\|_T^2$ are twice-differentiable and convex wrt $\boldsymbol{\theta}$

- $\nabla^2_{\boldsymbol{\theta}_j} P_j(\boldsymbol{\theta}_j)$ are PSD matrices for all j=1,...,J
- $\nabla_{\boldsymbol{\theta}}^2 ||y \sum_{j=1}^J g_j(x|\boldsymbol{\theta}_j)||_T^2$ is a PSD matrix.

Suppose for each j = 1, ..., J, there is a constant $K_j \ge 0$ such that for all β, θ, m' , we either have

$$\left| \frac{\partial}{\partial m} P_j(\boldsymbol{\theta} + m\boldsymbol{\beta}) \right|_{m = m'} \le K_j \|\boldsymbol{\beta}\|_2 \tag{5}$$

or

$$\left\| \frac{\partial}{\partial m} g_j(X_{T,j} | \boldsymbol{\theta} + m\boldsymbol{\beta}) \right|_{m=m'} = \sqrt{\sum_{i=1}^n \left(\frac{\partial}{\partial m} g_j(x_{T,j} | \boldsymbol{\theta} + m\boldsymbol{\beta}) \right|_{m=m'}} \right)^2 \le K_j \|\boldsymbol{\beta}\|_2$$
 (6)

(These conditions bound the spectrum of the penalty function or the function itself.) Let

$$C = \frac{1}{2} \left\| y - \sum_{j=1}^{J} g_j(\cdot | \boldsymbol{\theta}_j^*) \right\|_T^2 + \lambda_{max} \sum_{j=1}^{J} \left(P_j(\boldsymbol{\theta}_j^*) + \frac{w}{2} \| \boldsymbol{\theta}_j^* \|_2^2 \right)$$

For j = 1, ..., J, let

$$d_{j} = \begin{cases} \left(K_{j} + w\sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)\frac{2C}{\lambda_{min}w}}\right) & \text{if assumption (5) holds for } P_{j} \\ \frac{1}{\lambda_{min}}K_{j}\sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right)2C} & \text{if assumption (6) holds for } g_{j} \end{cases}$$

Then for any $\lambda^{(1)}, \lambda^{(2)} \in \Lambda$ we have for all j = 1, ..., J

$$\|\boldsymbol{\theta}_{\boldsymbol{\lambda}^{(1)},j} - \boldsymbol{\theta}_{\boldsymbol{\lambda}^{(2)},j}\| \leq \left\|\boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}\right\| \lambda_{min}^{-1} w^{-1} \left(\max_{j=1,..,J} d_j\right)$$

Proof

Consider any $\boldsymbol{\lambda}^{(1)}, \boldsymbol{\lambda}^{(2)} \in \Lambda$. Let $\boldsymbol{\beta}_j = \hat{\boldsymbol{\theta}}_{\lambda^{(2)},j} - \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}$ for all j=1,...,J. Define

$$\hat{\boldsymbol{m}}(\boldsymbol{\lambda}) = \arg\min_{\boldsymbol{m}} \frac{1}{2} \left\| y - \sum_{j=1}^{J} g_{j}(\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j}) \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j} \|_{2}^{2} \right)$$

By definition, we know that $\hat{\boldsymbol{m}}(\boldsymbol{\lambda}^{(2)}) = 1$ and $\hat{\boldsymbol{m}}(\boldsymbol{\lambda}^{(1)}) = 0$.

1. We calculate $\nabla_{\lambda} \hat{m}_k(\lambda)$ using the implicit differentiation trick.

By the KKT conditions, we have for all j = 1:J

$$\frac{\partial}{\partial m_j} \left(\frac{1}{2} \left\| y - \sum_{j=1}^J g_j (\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_j \boldsymbol{\beta}_j) \right\|_T^2 + \lambda_j P_j (\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_j \boldsymbol{\beta}_j) \right) + \lambda_j w \langle \boldsymbol{\beta}_j, \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_j \boldsymbol{\beta}_j \rangle \bigg|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} = 0$$
(7)

Now we implicitly differentiate with respect to λ_{ℓ} for $\ell=1,2,...,J$

$$\frac{\partial}{\partial \lambda_{\ell}} \left\{ \left[\frac{\partial}{\partial m_{j}} \left(\frac{1}{2} \left\| y - \sum_{j=1}^{J} g_{j} (\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_{j} \boldsymbol{\beta}_{j}) \right\|_{T}^{2} + \lambda_{j} P_{j} (\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_{j} \boldsymbol{\beta}_{j}) \right) + \lambda_{j} w \langle \boldsymbol{\beta}_{j}, \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_{j} \boldsymbol{\beta}_{j} \rangle \right] \bigg|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} \right\} = 0$$

By the product rule and chain rule, we have

$$\left\{ \sum_{k=1}^{J} \left[\frac{\partial^{2}}{\partial m_{k} \partial m_{j}} \left(\frac{1}{2} \left\| y - \sum_{j=1}^{J} g_{j} (\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j}) \right\|_{T}^{2} + 1[k = j] \lambda_{j} P_{j} (\hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j}) \right) + 1[k = j] \lambda_{j} w \|\boldsymbol{\beta}_{j}\|_{2}^{2} \right] \frac{\partial}{\partial \lambda_{\ell}} \hat{m}_{k}(\boldsymbol{\lambda}) \right\} \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} + 1[j = \ell] \left\{ \frac{\partial}{\partial m_{\ell}} P_{\ell} (\hat{\boldsymbol{\theta}}_{\lambda^{(1)}, \ell} + m_{\ell} \boldsymbol{\beta}_{\ell}) + w \langle \boldsymbol{\beta}_{\ell}, \hat{\boldsymbol{\theta}}_{\lambda^{(1)}, \ell} + m_{\ell} \boldsymbol{\beta}_{\ell} \rangle \right\} \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} = 0$$

Define the following matrices

$$S: S_{jk} = \frac{\partial^{2}}{\partial m_{k} \partial m_{j}} \frac{1}{2} \left\| y - \sum_{j=1}^{J} g_{j}(\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j}) \right\|_{T}^{2} \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})}$$

$$D_{1} = \operatorname{diag} \left(\frac{\partial^{2}}{\partial m_{j}^{2}} \lambda_{j} P_{j}(\hat{\boldsymbol{\theta}}_{\lambda^{(1)}, j} + m_{j} \boldsymbol{\beta}_{j}) \right) \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})}$$

$$D_{2} = \operatorname{diag} \left(\lambda_{j} w \| \boldsymbol{\beta}_{j} \|_{2}^{2} \right)$$

$$D_{3} = \operatorname{diag} \left(\frac{\partial}{\partial m_{\ell}} P_{\ell}(\hat{\boldsymbol{\theta}}_{\lambda^{(1)}, \ell} + m_{\ell} \boldsymbol{\beta}_{\ell}) + w \langle \boldsymbol{\beta}_{\ell}, \hat{\boldsymbol{\theta}}_{\lambda^{(1)}, \ell} + m_{\ell} \boldsymbol{\beta}_{\ell} \rangle \right) \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})}$$

$$M = \left(\nabla_{\lambda} \hat{m}_{1}(\lambda) \nabla_{\lambda} \hat{m}_{2}(\lambda) \dots \nabla_{\lambda} \hat{m}_{J}(\lambda) \right)$$

We can then combine all the equations into the following system of equations:

$$M = -D_3 \left(S + D_1 + D_2 \right)^{-1}$$

S is a PSD matrix since the composition of a convex function with an affine function is convex.

 D_1 is a PSD matrix since the penalty functions are convex.

2. We bound every diagonal element in D_3 :

By Cauchy-Schwarz,

$$\left| w \langle \boldsymbol{\beta}_k, \hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_k(\boldsymbol{\lambda}) \boldsymbol{\beta}_k \rangle \right| \leq w \|\boldsymbol{\beta}_k\| \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_k(\boldsymbol{\lambda}) \boldsymbol{\beta}_k\|$$

To bound $\|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_k(\boldsymbol{\lambda})\boldsymbol{\beta}_k\|$, we use the definition of $\hat{m}_k(\boldsymbol{\lambda})$:

$$\begin{split} & \left\| y - \sum_{j=1}^{J} g_{j}(\cdot|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + \hat{m}_{j}(\boldsymbol{\lambda})\boldsymbol{\beta}_{j}) \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} \left(P_{j} \left(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_{k}(\boldsymbol{\lambda})\boldsymbol{\beta}_{k} \right) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_{k}(\boldsymbol{\lambda})\boldsymbol{\beta}_{k} \|^{2} \right) \\ & \leq & \frac{1}{2} \| y - \sum_{j=1}^{J} g(\cdot|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) \|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} \left(P_{j} (\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} \|_{2}^{2} \right) \\ & = & \frac{1}{2} \| y - \sum_{j=1}^{J} g(\cdot|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) \|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j} (\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} \|_{2}^{2} \right) \\ & \leq & C + J \lambda_{max} \max_{j=1:J} \left(P_{j} (\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \| \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} \|_{2}^{2} \right) \end{split}$$

To bound the term $\max_{j=1:J} \left(P_j(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}\|_2^2 \right)$, we use the basic inequality for $\hat{\boldsymbol{\theta}}_{\lambda^{(1)}}$:

$$\sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}\|_{2}^{2} \right) \leq \frac{1}{2} \|y - \sum_{j=1}^{J} g(\cdot|\hat{\boldsymbol{\theta}}_{j}^{*})\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j}^{(1)} \left(P_{j}(\hat{\boldsymbol{\theta}}_{j}^{*}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{j}^{*}\|_{2}^{2} \right) \leq C$$

Since

$$\lambda_{min} \left(\max_{j=1:J} P_j(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}\|_2^2 \right) \leq \sum_{j=1}^J \lambda_j^{(1)} \left(P_j(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}\|_2^2 \right)$$

then we have that

$$\max_{j=1:J} P_{j}(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j}\|_{2}^{2} \leq \frac{C}{\lambda_{min}}$$

Therefore

$$\frac{1}{2} \left\| y - \sum_{j=1}^{J} g_j(\cdot|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + \hat{m}_j(\boldsymbol{\lambda})\boldsymbol{\beta}_j) \right\|_T^2 + \sum_{j=1}^{J} \lambda_j \left(P_j \left(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_k(\boldsymbol{\lambda})\boldsymbol{\beta}_k \right) + \frac{w}{2} \|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + \hat{m}_k(\boldsymbol{\lambda})\boldsymbol{\beta}_k \|^2 \right) \leq \left(1 + \frac{J\lambda_{max}}{\lambda_{min}} \right) C$$

This implies that

$$\|\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_{\ell}\boldsymbol{\beta}_{k}\| \le \sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) \frac{2C}{\lambda_{min}w}}$$
(8)

and

$$\left\| y - \sum_{j=1}^{J} g_j(\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + \hat{m}_j(\boldsymbol{\lambda}) \boldsymbol{\beta}_j) \right\|_T \le \sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) 2C}$$
(9)

If combine the assumption (5) with (8), we get

$$\left| \frac{\partial}{\partial m_k} P_k(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_k \boldsymbol{\beta}_k) + w \langle \boldsymbol{\beta}_k, \hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_k \boldsymbol{\beta}_k \rangle \right|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} \le \|\boldsymbol{\beta}_k\| \left(K_k + w \sqrt{\left(1 + \frac{J \lambda_{max}}{\lambda_{min}}\right) \frac{2C}{\lambda_{min} w}} \right)$$

On the other hand, suppose the other assumption (6) is satisfied. Then we will need to use the implicit differentiation equation (7). Rearranging, we get

$$\frac{\partial}{\partial m_{k}} \left(P_{k}(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_{k}\boldsymbol{\beta}_{k}) \right) \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} + w \langle \boldsymbol{\beta}_{k}, \hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_{k}\boldsymbol{\beta}_{k} \rangle = \frac{1}{\lambda_{k}} \left\langle \frac{\partial}{\partial m} g_{k} \left(\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_{k}\boldsymbol{\beta}_{k} \right) \Big|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})}, y - \sum_{j=1}^{J} g_{j} \left(\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + m_{j}\boldsymbol{\beta}_{j} \right) \right\rangle_{T} \\
\leq \frac{1}{\lambda_{min}} K_{k} \|\boldsymbol{\beta}_{k}\| \left\| y - \sum_{j=1}^{J} g_{j} \left(\cdot | \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} + \hat{m}_{j}(\boldsymbol{\lambda}) \boldsymbol{\beta}_{j} \right) \right\|_{T}$$

Plugging in (9), we get

$$\left| \frac{\partial}{\partial m_k} P_k(\hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_k \boldsymbol{\beta}_k) + w \langle \boldsymbol{\beta}_k, \hat{\boldsymbol{\theta}}_{\lambda^{(1)},k} + m_k \boldsymbol{\beta}_k \rangle \right|_{\boldsymbol{m} = \hat{\boldsymbol{m}}(\boldsymbol{\lambda})} \le \|\boldsymbol{\beta}_k\| \frac{1}{\lambda_{min}} K_k \sqrt{\left(1 + \frac{J \lambda_{max}}{\lambda_{min}}\right) 2C}$$

Using these upper bounds, we can bound D_3 by the diagonal matrix

$$\left\{ \max_{k=1,\dots,J} d_k \right\} diag\left(\left\{ \|\beta_k\| \right\}_{k=1}^J \right) \succeq D_3$$

where for k = 1, ..., J

$$d_k = \begin{cases} \left(K_k + w \sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) \frac{2C}{\lambda_{min}w}} \right) & \text{if assumption (5) holds for } k \\ \frac{1}{\lambda_{min}} K_k \sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) 2C} & \text{if assumption (6) holds for } k \end{cases}$$

3. We bound the norm of $\nabla_{\lambda} \hat{m}_k(\lambda)$ for all k = 1, ..., J.

For every k = 1, ..., J, we have

$$\|\nabla_{\lambda}\hat{m}_{k}(\lambda)\| = \|Me_{k}\|$$

$$= \|D_{3}(S + D_{1} + D_{2})^{-1} e_{k}\|$$

$$\leq \left\{ \max_{k=1,...,J} d_{k} \right\} \|diag\left(\{\|\beta\|_{k}\}_{k=1}^{J}\right) (S + D_{1} + D_{2})^{-1} e_{k}\|$$

$$\leq \left\{ \max_{k=1,...,J} d_{k} \right\} \max_{\ell} \|\beta_{\ell}\| \|(S + D_{1} + D_{2})^{-1} e_{k}\|$$

$$\leq \left\{ \max_{k=1,...,J} d_{k} \right\} \max_{\ell} \|\beta_{\ell}\| \|D_{2}^{-1} e_{k}\|$$

$$(10)$$

The last line follows from the matrix inverse lemma: Since $S + D_1$ is a PSD matrix, then

$$\|(S+D_1+D_2)^{-1}e_k\| \le \|D_2^{-1}e_k\|$$

Now consider (8) for

$$k \coloneqq \ell_{max} = \arg\max_{\ell} \|\boldsymbol{\beta}_{\ell}\|$$

(Notice we can choose any k in 1, ..., J. The inequality holds for all k so we just choose the k that is most interesting for our problem.) We have

$$\|\nabla_{\lambda} \hat{m}_{\ell_{max}}(\lambda)\| \leq \left\{ \max_{k=1,\dots,J} d_k \right\} \|\beta_{\ell_{max}}\| \|D_2^{-1} e_{\ell_{max}}\|$$

$$= \left\{ \max_{k=1,\dots,J} d_k \right\} \|\beta_{\ell_{max}}\| \lambda_{\ell_{max}}^{-1} w^{-1} \|\beta_{\ell_{max}}\|_2^{-2}$$

$$\leq \left\{ \max_{k=1,\dots,J} d_k \right\} \|\beta_{\ell_{max}}\|^{-1} \lambda_{min}^{-1} w^{-1}$$

4. Apply the Mean Value Theorem

Since the training criterion is smooth, then $\hat{m}_{\ell_{max}}(\lambda)$ is a continuous, differentiable function. By the MVT, we have that there exists an $\alpha \in (0,1)$ such that

$$\begin{aligned} \left| \hat{m}_{\ell_{max}}(\boldsymbol{\lambda}^{(2)}) - \hat{m}_{\ell_{max}}(\boldsymbol{\lambda}^{(1)}) \right| &= \left| \left\langle \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}, \nabla_{\lambda} \hat{m}_{\ell_{max}}(\boldsymbol{\lambda}) \right\rangle_{\boldsymbol{\lambda} = \alpha \boldsymbol{\lambda}^{(1)} + (1-\alpha)\boldsymbol{\lambda}^{(2)}} \right| \\ &\leq \left\| \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)} \right\| \left\{ \max_{k=1,\dots,J} d_k \right\} \lambda_{min}^{-1} w^{-1} \|\boldsymbol{\beta}_{\ell_{max}}\|^{-1} \end{aligned}$$

We know that $\hat{m}_k(\boldsymbol{\lambda}^{(2)}) - \hat{m}_k(\boldsymbol{\lambda}^{(1)}) = \mathbf{1}$ for all k = 1, ..., J. Rearranging the inequality above, we get

$$\max_{k} \| \boldsymbol{\theta}_{\lambda^{(1)},k} - \boldsymbol{\theta}_{\lambda^{(2)},k} \| = \| \boldsymbol{\beta}_{\ell_{max}} \| \leq \left\| \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)} \right\| \left\{ \max_{k=1,...,J} d_k \right\} \lambda_{min}^{-1} w^{-1}$$

3 Nonsmooth Penalties

Suppose we are dealing with parametric regression problems from Section 1 or 2. We keep all the same assumptions, except those that concern the smoothness of the penalties.

Recall that $\Lambda \subseteq \mathbb{R}^J$. Consider the measure space over Λ with respect to the Lebesgue measure μ . We suppose that for a given dataset (X, y), suppose the following three assumptions hold:

Assumption (1): Let the penalized training criterion be denoted $L_T(\theta, \lambda)$. Denote the differentiable space of $L_T(\cdot, \lambda)$ at any point θ as

$$\Omega^{L_{T}(\cdot,\lambda)}(\boldsymbol{\theta}) = \left\{ \boldsymbol{\eta} | \lim_{\epsilon \to 0} \frac{L_{T}(\boldsymbol{\theta} + \epsilon \boldsymbol{\eta}) - L_{T}(\boldsymbol{\theta})}{\epsilon} \text{ exists} \right\}$$

Suppose there is a set $\Lambda_{smooth} \subseteq \Lambda$ such that $\mu\left(\Lambda_{smooth}^C\right) = 0$ and for every $\lambda \in \Lambda_{smooth}$, there exists a ball with nonzero radius centered at λ , denoted $B(\lambda)$, such that the following conditions hold:

Cond 1: For all $\lambda' \in B(\lambda)$, the training criterion $L_T(\cdot, \cdot)$ is twice differentiable along directions in $\Omega^{L_T(\cdot, \cdot)}(\hat{\boldsymbol{\theta}}_{\lambda})$. (So technically the twice-differentiable space is constant)

Cond 2: $\Omega^{L_T(\cdot,\lambda)}\left(\hat{\boldsymbol{\theta}}_{\lambda}\right)$ is a local optimality space of $B(\lambda)$:

$$\arg\min_{\boldsymbol{\theta}\in\Theta} L_T\left(\boldsymbol{\theta},\boldsymbol{\lambda}'\right) = \arg\min_{\boldsymbol{\theta}\in\Omega^{L_T(\cdot,\boldsymbol{\lambda})}\left(\hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}}\right)} L_T\left(\boldsymbol{\theta},\boldsymbol{\lambda}'\right) \ \forall \boldsymbol{\lambda}' \in B(\boldsymbol{\lambda})$$

Cond 3: (Not necessary if we keep the ridge penalty) There is an orthonormal basis U_{λ} of $\Omega^{L_{T}(\cdot,\lambda)}\left(\hat{\boldsymbol{\theta}}_{\lambda}\right)$ such that the Hessian of the training criterion taken along directions U_{λ} is invertible.

Assumption (2): For every $\lambda^{(1)}$, $\lambda^{(2)} \in \Lambda_{smooth}$, let the line segment between the two points be denoted

$$\mathcal{L}(\boldsymbol{\lambda^{(1)}}, \boldsymbol{\lambda^{(2)}}) = \left\{ \alpha \boldsymbol{\lambda^{(1)}} + (1 - \alpha) \boldsymbol{\lambda^{(2)}} : \alpha \in [0, 1] \right\}$$

Suppose the intersection $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)}) \cap \Lambda^{C}_{smooth}$ is countable.

Assumption (3): All the conditions specified in Section 1 and 2 that bound the spectrum of P_j or g_j only need to apply when the directional derivatives exist. That is, the condition on the spectrum of the penalty derivative is now

$$\left| \frac{\partial}{\partial m} P_j \left(\boldsymbol{\theta} + m \boldsymbol{\beta} \right) \right| \le K \|\boldsymbol{\beta}\|_2 \text{ if } \frac{\partial}{\partial m} P_j \left(\boldsymbol{\theta} + m \boldsymbol{\beta} \right) \text{ exists}$$

Similarly, we would change the condition on the spectrum of the function derivative to

$$\left| \frac{\partial}{\partial m} g_j \left(\boldsymbol{\theta} + m \boldsymbol{\beta} \right) \right| \le K \|\boldsymbol{\beta}\|_2 \text{ if } \frac{\partial}{\partial m} g_j \left(\boldsymbol{\theta} + m \boldsymbol{\beta} \right) \text{ exists}$$

Under these assumptions, the same Lipschitz conditions hold for dataset (X, y) and every $\lambda^{(1)}, \lambda^{(2)} \in \Lambda_{smooth}$.

Proof

Consider any $\lambda^{(1)}, \lambda^{(2)} \in \Lambda_{smooth}$. The length of $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$ covered by set A can be expressed as

$$\mu_1\left(A\cap\mathcal{L}(\boldsymbol{\lambda^{(1)}},\boldsymbol{\lambda^{(2)}})\right)$$

where μ_1 is the Lebesgue measure over the line segment $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$. (So if $A \cap \mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$ is just a line segment, it is the length $||A \cap \mathcal{L}(\lambda^{(1)}, \lambda^{(2)})||_2$)

By the Differentiability Cover Lemma below, there exists a countable set of points $\bigcup_{i=1}^{\infty} \ell^{(i)} \subset \mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$ such that the union of their "balls of differentiabilities" entirely cover $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$:

$$\max_{\{\boldsymbol{\ell}^{(i)}\}_{i=1}^{\infty}} \mu_1\left(\cup_{i=1}^{\infty} B(\boldsymbol{\ell}^{(i)}) \cap \mathcal{L}\left(\boldsymbol{\lambda^{(1)}}, \boldsymbol{\lambda^{(2)}}\right)\right) = \left\|\mathcal{L}\left(\boldsymbol{\lambda^{(1)}}, \boldsymbol{\lambda^{(2)}}\right)\right\|_2$$

Let

$$\left\{\boldsymbol{\ell}_{max}^{(i)}\right\}_{i=1}^{\infty} = \left\{\arg\max_{\left\{\boldsymbol{\ell}^{(i)}\right\}} \mu_1\left(\cup_{i=1}^{\infty} B(\boldsymbol{\ell}^{(i)}) \cap \mathcal{L}\left(\boldsymbol{\lambda^{(1)}}, \boldsymbol{\lambda^{(2)}}\right)\right)\right\} \cup \left\{\boldsymbol{\lambda}^{(1)}, \boldsymbol{\lambda}^{(2)}\right\}$$

Let P be the intersections of the boundary of $B\left(\ell_{max}^{(i)}\right)$ with the line segment $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$:

$$P = \bigcup_{i=1}^{\infty} \operatorname{Bd} B\left(\ell_{max}^{(i)}\right) \cap \mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$$

Every point $p \in P$ can be expressed as $\alpha_p \lambda^{(1)} + (1-\alpha_p) \lambda^{(2)}$ for some $\alpha_p \in [0,1]$. This means we can order these points $\{p^{(i)}\}_{i=1}^{\infty}$ by increasing α_p . By our assumptions, the differentiable space of the training criterion must be constant over the interior of line segment $\mathcal{L}\left(p^{(i)}, p^{(i+1)}\right)$ (so there might be bad behavior at the endpoints). Let the differentiable space over the interior of line segment $\mathcal{L}\left(p^{(i)}, p^{(i+1)}\right)$ be denoted Ω_i .

By our assumptions, the differentiable space is also a local optimality space. Let $U^{(i)}$ be an orthonormal basis of Ω_i . For each i, we can express $\hat{\boldsymbol{\theta}}_{\lambda}$ for all $\boldsymbol{\lambda} \in \operatorname{Int} \left\{ \mathcal{L}\left(\boldsymbol{p^{(i)}}, \boldsymbol{p^{(i+1)}}\right) \right\}$ as

$$\hat{\boldsymbol{\theta}}_{\lambda} = U^{(i)} \hat{\boldsymbol{\beta}}_{\lambda}$$

$$\hat{\boldsymbol{\beta}}_{\lambda} = \arg\min_{\beta} L_T(U^{(i)} \boldsymbol{\beta}, \boldsymbol{\lambda})$$

Now apply the result in Section 1 or 2 over every line segment $\mathcal{L}(p^{(i)}, p^{(i+1)})$. To do this, we must modify the proofs to take directional derivatives along the columns of $U^{(i)}$. We can establish that there is a constant c > 0 independent of i such that for all i = 1, 2..., we have

$$\left\|\hat{\boldsymbol{\beta}}_{p^{(i)}} - \hat{\boldsymbol{\beta}}_{p^{(i+1)}}\right\|_{2} \le c \|\boldsymbol{p^{(i)}} - \boldsymbol{p^{(i+1)}}\|_{2}$$

Finally, we can sum these inequalities. By the triangle inequality,

$$\begin{split} \left\| \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(1)}} - \hat{\boldsymbol{\theta}}_{\boldsymbol{\lambda}^{(2)}} \right\|_{2} & \leq \sum_{i=1}^{\infty} \| \hat{\boldsymbol{\theta}}_{p^{(i)}} - \hat{\boldsymbol{\theta}}_{p^{(i+1)}} \|_{2} \\ & = \sum_{i=1}^{\infty} \| U^{(i)} \hat{\boldsymbol{\beta}}_{p^{(i)}} - U^{(i)} \hat{\boldsymbol{\beta}}_{p^{(i+1)}} \|_{2} \\ & = \sum_{i=1}^{\infty} \| \hat{\boldsymbol{\beta}}_{p^{(i)}} - \hat{\boldsymbol{\beta}}_{p^{(i+1)}} \|_{2} \\ & \leq \sum_{i=1}^{\infty} c \| \boldsymbol{p^{(i)}} - \boldsymbol{p^{(i+1)}} \|_{2} \\ & = c \| \boldsymbol{\lambda}^{(1)} - \boldsymbol{\lambda}^{(2)} \|_{2} \end{split}$$

Lemma - Differentiability Cover

For any $\lambda^{(1)}, \lambda^{(2)} \in \Lambda_{smooth}$, there exists a countable set of points $\bigcup_{i=1}^{\infty} \ell^{(i)} \subset \mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$ such that the union of their "balls of differentiabilities" entirely cover $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$

$$\max_{\{\boldsymbol{\ell}^{(i)}\}_{i=1}^{\infty}} d_{\boldsymbol{\lambda^{(1)}},\boldsymbol{\lambda^{(2)}}} \left(\cup_{i=1}^{\infty} B(\boldsymbol{\ell}^{(i)}) \right) = \left\| \mathcal{L}(\boldsymbol{\lambda^{(1)}},\boldsymbol{\lambda^{(2)}}) \right\|$$

Proof

We prove this by contradiction. Let

$$\left\{\boldsymbol{\ell}_{max}^{(i)}\right\}_{i=1}^{\infty} = \arg\max_{\left\{\boldsymbol{\ell}^{(i)}\right\}_{i=1}^{\infty}} d_{\boldsymbol{\lambda^{(1)}},\boldsymbol{\lambda^{(2)}}} \left(\cup_{i=1}^{\infty} B(\boldsymbol{\ell}^{(i)}) \right)$$

and for contradiction, suppose that the covered length is less than the length of the line segment:

$$d_{\boldsymbol{\lambda^{(1)}},\boldsymbol{\lambda^{(2)}}}\left(\cup_{i=1}^{\infty}B(\boldsymbol{\ell}_{max}^{(i)})\right)<\left\|\mathcal{L}(\boldsymbol{\lambda^{(1)}},\boldsymbol{\lambda^{(2)}})\right\|$$

By assumption (2), since $\mathcal{L}(\boldsymbol{\lambda^{(1)}}, \boldsymbol{\lambda^{(2)}}) \cap \Lambda^{C}_{smooth}$ is countable, there must exist a point $p \in \mathcal{L}(\boldsymbol{\lambda^{(1)}}, \boldsymbol{\lambda^{(2)}}) \setminus \left\{ \bigcup_{i=1}^{\infty} B(\boldsymbol{\ell_{max}^{(i)}}) \right\}$ such that $p \notin \Lambda^{C}_{smooth}$. However if we consider the set of points $\left\{ \boldsymbol{\ell_{max}^{(i)}} \right\}_{i=1}^{\infty} \cup \{p\}$, then

$$d_{\pmb{\lambda^{(1)}},\pmb{\lambda^{(2)}}}\left(\cup_{i=1}^{\infty}B(\pmb{\ell}_{max}^{(i)})\right) < d_{\pmb{\lambda^{(1)}},\pmb{\lambda^{(2)}}}\left(\cup_{i=1}^{\infty}B(\pmb{\ell}_{max}^{(i)}) \cup B(p)\right)$$

This is a contradiction of the definition of $\{\ell_{max}^{(i)}\}$. Therefore we should always be able to cover $\mathcal{L}(\lambda^{(1)}, \lambda^{(2)})$ with "balls of differentiability."

4 Example

4.1 Penalties that satisfy the conditions

We will show penalties that satisfy the condition

$$\frac{\partial}{\partial m} P(\boldsymbol{\theta} + m\boldsymbol{\beta}) \le K \|\boldsymbol{\beta}\|_2$$

for some constant K > 0.

Ridge:

The perturbation isn't necessary if there is already a ridge penalty in the original penalized regression problem. Just set the penalties $P_j(\theta) \equiv 0$ and fix w = 2.

Lasso:

$$\frac{\partial}{\partial m} \|\theta + m\beta\|_{1} = \langle sgn(\theta + m\beta), \beta \rangle$$

$$\leq \|sgn(\theta + m\beta)\|_{2} \|\beta\|_{2}$$

$$\leq p\|\beta\|_{2}$$

so K = p in this case.

Generalized Lasso: let G be the maximum eigenvalue of D.

$$\frac{\partial}{\partial m} \|D(\theta + m\beta)\|_{1} = \langle sgn(D(\theta + m\beta)), D\beta \rangle$$

$$\leq \|sgn(D(\theta + m\beta))\|_{2} \|D\beta\|_{2}$$

$$\leq pG\|\beta\|_{2}$$

so K = pG in this case.

Group Lasso:

If we have un-pooled penalty parameters as follows

$$\sum_{j=1}^{J} \lambda_{j} \| \boldsymbol{\theta}^{(j)} + m^{(j)} \boldsymbol{\beta}^{(j)} \|_{2}$$

then we need the following bound for every j = 1, ..., J

$$\frac{\partial}{\partial m^{(j)}} \|\boldsymbol{\theta}^{(j)} + m^{(j)} \boldsymbol{\beta}^{(j)}\|_{2} = \left\langle \frac{\boldsymbol{\theta}^{(j)} + m^{(j)} \boldsymbol{\beta}^{(j)}}{\|\boldsymbol{\theta}^{(j)} + m^{(j)} \boldsymbol{\beta}^{(j)}\|_{2}}, \boldsymbol{\beta}^{(j)} \right\rangle$$

$$\leq \|\boldsymbol{\beta}^{(j)}\|_{2}$$

So K = 1 in this case.

If there is a single penalty parameter for the entire group laso penalty as follows

$$\lambda \sum_{j=1}^{J} \|\boldsymbol{\theta}^{(j)} + m\boldsymbol{\beta}^{(j)}\|_{2}$$

then

$$\frac{\partial}{\partial m} \sum_{j=1}^{J} \|\boldsymbol{\theta}^{(j)} + m\boldsymbol{\beta}^{(j)}\|_{2} = \sum_{j=1}^{J} \left\langle \frac{\boldsymbol{\theta}^{(j)} + m\boldsymbol{\beta}^{(j)}}{\|\boldsymbol{\theta}^{(j)} + m\boldsymbol{\beta}^{(j)}\|_{2}}, \boldsymbol{\beta}^{(j)} \right\rangle$$

$$\leq \sum_{j=1}^{J} \|\boldsymbol{\beta}^{(j)}\|_{2}$$

$$\leq \sqrt{J} \|\boldsymbol{\beta}\|_{2}$$

and $K = \sqrt{J}$.

4.2 Sobolev

Given a function h, the Sobolev penalty for h is

$$P(h) = \int (h^{(r)}(x))^2 dx$$

The Sobolev penalty is used in nonparametric regression models, but such nonparametric regression models can be re-expressed in parametric form. We will use this to understand the smoothness of models fitted in this manner.

Consider the class of smoothing splines

$$\left\{ \hat{g}(\cdot|\lambda) = \arg\min_{g \in \mathcal{G}} \frac{1}{2} \left\| y - \sum_{j=1}^{J} g_j(x_j) \right\|_T^2 + \sum_{j=1}^{J} \lambda_j P(g_j) : \lambda \in \Lambda \right\}$$

Each function $\hat{g}_j(\cdot|\lambda)$ is a spline that can be expressed as the weighted sum of B normalized B-splines of degree r+1 for a given set of knots:

$$\hat{g}_j(x|\lambda) = \sum_{i=1}^B \theta_i N_{j,i}(x)$$

Note that the normalized B-splines have the property that they sum up to one at all points within the boundary of the knots. Also recall that B-splines are non-negative.

Therefore we can re-express the class of smoothing splines as a set of function parameters

$$\left\{ \hat{\boldsymbol{\theta}}_{\lambda} = \arg\min_{\boldsymbol{\theta}} \frac{1}{2} \left\| y - \sum_{j=1}^{J} N_{T,j} \boldsymbol{\theta}_{j} \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} P_{j}(\boldsymbol{\theta}_{j}) : \lambda \in \Lambda \right\}$$

where $N_{T,j}$ is a matrix of the evaluations of the normalized B-spline basis at x_j . $P_j(\boldsymbol{\theta_j})$ is the Sobolev penalty and can be written as $\boldsymbol{\theta}_j^T V_j \boldsymbol{\theta}_j$ for an appropriate penalty matrix V_j . We will not need to express anything in terms of V_j so the penalty will be just written as $P_j(\boldsymbol{\theta_j})$.

Instead of considering the original smoothing spline problem with the roughness penalty, we will add a ridge penalty on the function parameters

$$\left\{\hat{\boldsymbol{\theta}}_{\lambda} = \arg\min_{\boldsymbol{\theta}} \frac{1}{2} \left\| y - \sum_{j=1}^{J} N_{T,j} \boldsymbol{\theta}_{j} \right\|_{T}^{2} + \sum_{j=1}^{J} \lambda_{j} \left(P_{j}(\boldsymbol{\theta}_{j}) + \frac{w}{2} \|\boldsymbol{\theta}_{j}\|_{2}^{2} \right) : \lambda \in \Lambda \right\}$$

Let

$$C = \frac{1}{2} \left\| y - \sum_{j=1}^{J} N_{T,j} \boldsymbol{\theta}_{j}^{*} \right\|_{T}^{2} + \lambda_{max} \sum_{j=1}^{J} \left(P_{j}(\boldsymbol{\theta}_{j}^{*}) + \frac{w}{2} \|\boldsymbol{\theta}_{j}^{*}\|_{2}^{2} \right)$$

Then for any $\lambda^{(1)}, \lambda^{(2)} \in \Lambda$ we have for all j = 1, ..., J

$$\|\boldsymbol{\theta}_{\lambda^{(1)},j} - \boldsymbol{\theta}_{\lambda^{(2)},j}\|_2 \leq \left\|\boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)}\right\|_2 \lambda_{min}^{-1} w^{-1} \left(\frac{1}{\lambda_{min}} B \sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) \frac{2C}{\lambda_{min} w}}\right)$$

Moreover,

$$\left\| \sum_{j=1}^{J} \hat{g}_{j}(x_{j}|\boldsymbol{\lambda}^{(1)}) - \hat{g}_{j}(x_{j}|\boldsymbol{\lambda}^{(2)}) \right\|_{\infty} \leq \left\| \boldsymbol{\lambda}^{(2)} - \boldsymbol{\lambda}^{(1)} \right\|_{2} J\sqrt{B} \lambda_{min}^{-1} w^{-1} \left(\frac{1}{\lambda_{min}} B \sqrt{\left(1 + \frac{J\lambda_{max}}{\lambda_{min}}\right) \frac{2C}{\lambda_{min}w}} \right)$$

Proof

To apply the result from Section 2, we just need to bound the spectral norm

$$\|\nabla_{\theta}g_j(X_{T,j}|\boldsymbol{\theta})\| = \|N_{T,j}\|$$

Note that the eigenvalue of $N_{T,j}$ is bounded by B since the maximum eigenvalue of a non-negative matrix is bounded by its maximum row sum. In the case of $N_{T,j}$, since it is the values of normalized B-splines, each row is at most the number of B-spline basis functions. That is, we have for all j = 1, ..., J

$$\|\nabla_{\theta}g_{i}(X_{T,i}|\boldsymbol{\theta})\| = \|N_{T,i}\| \leq B$$

Hence for all θ, β, m' , we have

$$\left\| \frac{\partial}{\partial m} g_j(X_{T,j} | \boldsymbol{\theta} + m\boldsymbol{\beta}) \right|_{m=m'} \le B \|\boldsymbol{\beta}\|$$

Apply the result from Section 2 to get the result

$$\left\|\boldsymbol{\theta}_{\lambda^{(1)},j}-\boldsymbol{\theta}_{\lambda^{(2)},j}\right\|_{2}\leq\left\|\boldsymbol{\lambda}^{(2)}-\boldsymbol{\lambda}^{(1)}\right\|_{2}\lambda_{min}^{-1}w^{-1}\left(\frac{1}{\lambda_{min}}B\sqrt{\left(1+\frac{J\lambda_{max}}{\lambda_{min}}\right)\frac{2C}{\lambda_{min}w}}\right)$$

The "moreover" statement follows from the fact that for any point x, we have

$$\left| \sum_{j=1}^{J} \hat{g}_{j}(x_{j}|\boldsymbol{\lambda}^{(1)}) - \hat{g}_{j}(x_{j}|\boldsymbol{\lambda}^{(2)}) \right| = \left| \sum_{j=1}^{J} \sum_{i=1}^{B} \left(\hat{\theta}_{\lambda^{(1)},j,i} - \hat{\theta}_{\lambda^{(2)},j,i} \right) N_{j,i}(x_{j}) \right|$$

$$\leq \sum_{j=1}^{J} \sum_{i=1}^{B} \left| \left(\hat{\theta}_{\lambda^{(1)},j,i} - \hat{\theta}_{\lambda^{(2)},j,i} \right) N_{j,i}(x_{j}) \right|$$

$$\leq \sum_{j=1}^{J} \sum_{i=1}^{B} \left| \hat{\theta}_{\lambda^{(1)},j,i} - \hat{\theta}_{\lambda^{(2)},j,i} \right|$$

$$\leq \sum_{j=1}^{J} \|\hat{\theta}_{\lambda^{(1)},j} - \hat{\theta}_{\lambda^{(2)},j} \|_{1}$$

$$\leq \sqrt{B} \sum_{j=1}^{J} \|\hat{\theta}_{\lambda^{(1)},j} - \hat{\theta}_{\lambda^{(2)},j} \|_{2}$$

where the second inequality uses the fact that normalized B-splines have value at most 1. Therefore

$$\left\| \sum_{j=1}^{J} \hat{g}_{j}(x_{j}|\lambda^{(1)}) - \hat{g}_{j}(x_{j}|\lambda^{(2)}) \right\|_{\infty} \leq \sqrt{B} \sum_{j=1}^{J} \left\| \hat{\boldsymbol{\theta}}_{\lambda^{(1)},j} - \hat{\boldsymbol{\theta}}_{\lambda^{(2)},j} \right\|_{2}$$
